

Reptaid was developed to target common reptile & amphibians health issues. Think of it as a herbal health tonic for reptiles. It includes a variety of organic oils and herbs specifically chosen for their ability to fight against parasites and infection. Reptile keepers, veterinarians and breeders, have all attested to its effectiveness in helping to restore reptile health.

Reptaid has been used successfully on dozens of different species of snakes, lizards, chelonians as well as frogs and toads. It comes in two sizes, Reptaid for small reptiles and Reptaid XL for reptiles over 250 grams in body weight.

## USES

Reptaid has been used against:

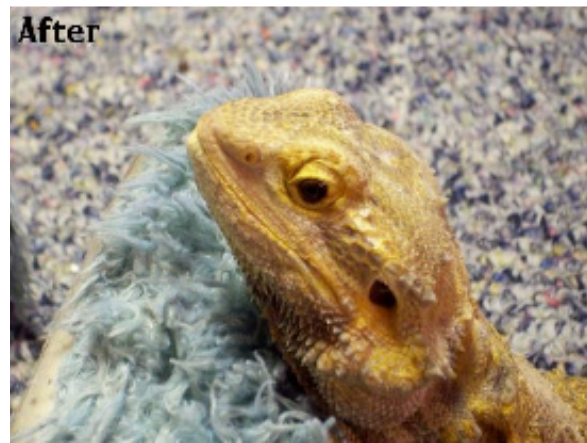

- Coccidia and other internal parasites
- Bacterial infections
- Loss of appetite
- Loss of coloration
- Low libido

## TESTIMONIALS

### *Bearded Dragons*

"A female bearded dragon I rescued had a nasty case of mouth rot and in many cases mouth rot can't be treated in bearded dragons. I had great success with this on a dragon with a Respiratory Infection so I decided to give it a try and in about 10 days the females mouth rot was 100% gone all of the swelling, sores, and infection on her lips and gums had disappeared she has a great appetite now and her colour is coming back she is much happier and will no longer have to deal with useless ointments and medications what the vet gave me did nothing in 2 months she was on it and in 10 days of using Reptaid she was cured." Nicole, Bearded Dragon Breeder

**“I just wanted to drop you an email to thank you for introducing me to Reptaid. I received my order a few weeks ago and immediately started giving it to one of my male dragons who was not eating and had parasite counts which were very high. He had been given Albon to treat this and I had seen no results besides him deteriorating consistently despite my best efforts. Over the last month he was deteriorating quickly. He refused food of every kind and I had to supplement him just to keep him going. Who knows what would have happened if I didn't try Reptaid. I started giving Reptaid in a 3ml dose , he had dropped to just over 300g, and within the first two days started eating greens and a few insects. Within a week he was eating much stronger and getting colour back. Ten days after giving him Reptaid, fecal went out again and he is in the clear! It has been about three weeks and he is putting weight back on fast. He eats like a horse and is colourful and alert. Thanks again!”** Chris Patrick, Showtime Dragons

---

**“I tried Reptaid because I heard from other bearded dragon breeders that are having great success with it. I found out for myself that it really does work. I have a baby male beardie who just stopped growing and eating. I have been giving him Reptaid for a little over a week and now he is eating on his own again and he has put on a little weight. I also have an adult male who gave himself a mouth infection by slamming his face into the side of his tank bobbing at the ladies. I am currently giving him Reptaid and his mouth is almost healed. Thank-you so much.”**

### ***Chameleons***

**“I had a small female veiled that seemed to have "given up on life". she wouldn't eat, drink or move. When I picked her up she couldn't even hold on. After 10 days of Reptaid she started eating and drinking on her own again and now is doing great!!!**

**Just FYI to those thinking of buying it I found this product is working to reduce (and I expect will eliminate) pinworms in an otherwise healthy male panther. I also attribute it to a good, complete shed that was overdue.”** Chameleon breeder

---

"I just wanted to say that this product is AMAZING! My [panther chameleon] girl seemed to almost have given up. She wouldn't hiss or gape and she didn't hold my fingers like she normally does. (Usually she squeezes the crap out of them!) I gave her her first dose and the next morning she looked a little better and seemed to have more fight in her. Now, a few days into the treatment, she is just about back to normal! Her mouth rot looks a lot better (though not completely gone yet.) I was afraid I might have to put her down because nothing seemed to work very well but now there is no chance of that happening! I'm glad I bought this. She hasn't responded this positively to any other treatments. " Chameleon breeder

## USING REPTAID WITH FROGS

" Frogs do not normally drink water like other animals. They absorb moisture through their skin. So I had the idea to try adding Reptaid to their water dish so when they came down to soak in the water they would absorb some Reptaid also. But I had a number of frogs who just didn't come and sit in the water, so I decided to prepare a way to soak them in water mixed with Reptaid. I mixed the Reptaid with the water and put the solution in a glass mason jar.

Then I put the frog into the jar with the mixture and left him in there for about 20 minutes a day. I only used enough water for the various species of frogs I was treating. The larger the frog, the more water/Reptaid mixture I used. For the smaller frogs I used just a small amount of water so the frog was sitting in the water but not too deep. The mixture I used was .1ml of Reptaid per 8oz of water. Here are some of the amazing results.

### *White's Tree Frogs*

I have a mating pair of White's Tree Frogs who have been sleeping all the time , eating very little and never mating. They are silent at night, never calling to each other. This has been going on for some time. So I put 1 cup of water with the .1ml of Reptaid in a quart size glass mason jar and placed the frogs in the water one at a time. I left each one in there for 20 – 30 minutes. I discarded the solution every day. After just 3 days of treatment, I heard them calling to each other in their enclosure. I had not heard that wonderful sound in a long, long time. They are eating and moving about and croaking just like normal healthy frogs again. Whatever was wrong with them, Reptaid surely helped make it right.

### *Waxy Monkey Tree Frog*

I had a clutch of waxy's hatch recently. Most of the little frogs now weigh 40 grams. But one little guy only weighs 7 grams and I really thought he was just going to perish. So I tried the Reptaid in the water in the jar but I only used a little bit of water because he is so small. After a few days of treatment, the little guy was eating very well. Now, one month later he weighs 20 grams and is quickly catching up with his clutch mates. This is nothing less than a miracle. "

## USING REPTAID WITH SNAKES

**Trial #1** Texas Bull Snake, 5 years old. Had been eating and losing weight. I tried panacure and flagyl (usually works) and there was no change. Used 1 dropper of Reptaid in a pre-killed mouse...fed the snake every other day for 5 feedings (10 days). It has been three weeks since the last dose and the snake is gaining weight (feces are normal). I expect a full recovery.

**Trial #2** Black Throat Monitor (about 30 lbs.) Has been eating rats without issue for several years. Recently went completely off feed for a few days. I got her interested in chicken parts and started liberally (3 droppers per 1/4 lb chicken) adding Reptaid. After a week of chicken parts she has regained her interest in rats and is eating as if there was never an issue.

**Trial #3** Leopard Gecko, about 6 mos old started going "downhill" and was not responding well to medication. We diluted the Reptaid and gave it directly by mouth for 7 days. The gecko initially seemed to show no change. We continued to feed Phoenix worms and crickets and now, several weeks later I can't tell which Gecko was the sickly one when they are all back together.

In each case I believe that the Reptaid helped make a difference as I have seen these symptoms before in other animals that did not do well following conventional treatments.

Ron Greenberg, Ron's Reptiles, California, USA

"I am a partner in an exotic reptile store (Mainly Pets) in Rochester, NH and we have animals coming and going all the time. Anyone owning a reptile store knows that you are going to get a sick animal now and then. We had a young lemon pastel ball python (180 grams) come into the store and he looked healthy when we received him. After about a week I noticed him blowing bubbles and gasping for air. He had a very bad case of respiratory infection. I have seen animals at this stage that were treated with antibiotics and still did not survive.

I was at a show and I overheard someone talking about Reptaid and how well it worked for respiratory problems. I figured for \$30.00 it was worth a try and much cheaper than a vet visit for \$150.00 with no assurance that the antibiotics would work. I read the directions and administered the dose for his size not really knowing how this would turn out. When I started the treatment he could not even close his mouth as he was gasping for so much air. On top of this he also went into shed, which also added stress to him. To say the least it looked rather gloomy. I continued the dosage every day as prescribed for 10 days like it said.

At the end of 10 days his infection was not completely gone but amazingly he was about 75 percent better. I rested him for 2 days and started a second treatment as the instructions indicated. After 15 days the infection was completely gone, he had shed in the process, was more

alert and lively than I had ever seen him. He also took his first meal after a 6-week period. I was so impressed with the Reptaid that I [became] a reseller for this awesome product so that I could offer our customers an alternative solution from an expensive vet bill as well as give them a product that I know works first hand”

Mark Kovel, Mainelypets, Rochester, USA

## ADMINISTRATION

Administering Reptaid is easy. Depending on the reptile species it is either added to a food item, to drinking or bath water, or squirted directly into the mouth.

Each bottle contains approximately 300 doses and the solution lasts for a year in the fridge. (Shelf life is indefinite if bottle is not opened and seal remains intact.) Full instructions and a syringe are included with all bottles of Reptaid.

## INGREDIENTS

**Olive Leaf** - helps keep colds and flu at bay, supports immune system, high in antioxidants. Olive Leaf is an excellent anti-microbial that will kill viruses and bacteria.

**Mustard Seed** - used in fevers, colds and influenza. Helps move acute conditions from the body more quickly.

**Black Seed** - an overall tonic herb known for its effects on the respiratory system, stomach and intestinal tract, kidney and liver, and the circulatory and immune system.

**Pau D’arco** - South American herb that is used for parasites and fungus. Also used for dry cough, anti-inflammatory and blood cleansing. We also use this herb for it’s anti-bacterial properties.

**Cloves** - To rid the body of any microscopic parasites and soothes the intestinal tract. Strong disinfecting action.

**Grapefruit Seed Extract** – Used as a parasitic for small parasites. Has anti-bacterial, anti-fungal and anti-viral properties.

**Alcohol** - To bring out the properties in the herbs and preserve the tincture.

**Distilled Water.**
